M_BaseColor_Lite / Base Color Lite Material

Description

Base Color Lite is a simple emission-driven material setup designed for stylized VFX surfaces using a single texture input.

It is intended as a lightweight foundation for animated shader materials in the **Magic Energy VFX Shader Lite Pack**.

The material uses the original texture color and allows basic control over tint, brightness, and tiling.

This Lite version is designed to be simple, fast, and easy to use.

Use Cases

Recommended for:

- Stylized energy surfaces
- Magic texture previews
- Simple glowing planes
- VFX display meshes
- Portals and energy fields
- Fantasy / casual game effects
- Demo materials for Flow, Wave, and Distortion Lite shaders

Input Data

Required

Base Texture

Recommended texture properties:

- Seamless / tileable
- Clear visible shapes
- Good contrast between bright and dark areas

- Works well as an emissive-style surface
- Suitable for stylized VFX materials

This Lite material does not require PBR maps such as Normal, Roughness, Metallic, AO, or Height maps.

Parameters

01 Texture

Base Texture

Primary texture input used as the visible surface pattern.

The texture color is used directly without custom gradient recoloring.

Tiling

Default: `1, 1`

Controls how many times the texture repeats across the surface.

Recommended values:

1, 1 — original texture scale

2, 2 — smaller repeated pattern

0.5, 0.5 — larger, softer pattern

Use moderate tiling values to avoid visible repetition.

---

02 Color

Base Texture Tint

Default: White

Multiplies the original texture color.

Use this parameter to slightly recolor or darken the material without changing the source texture.

Recommended usage:

White — keeps original texture color

Soft blue / purple — magic energy look

Orange / yellow — fire or warm glow look

Green — toxic or acid look

Gray / darker tint — softer, less intense result

---

03 Brightness

Emission Intensity

Default: 2

Controls the overall brightness of the material.

Recommended values:

1–2 — soft glow

2–4 — standard stylized VFX brightness

4–6 — strong glow for demo scenes

Higher values may look brighter when Bloom is enabled in the scene.

Recommended Settings

Magic / Energy

Base Texture Tint: Blue / Purple / Cyan

Emission Intensity: 2–4

Tiling: 1,1 or 2,2

Fire / Warm Energy

Base Texture Tint: Orange / Yellow

Emission Intensity: 2–5

Tiling: 1,1

Soft Background Glow

Base Texture Tint: White or soft color

Emission Intensity: 1–2

Tiling: 0.5,0.5 or 1,1

Best Practices

- Use seamless textures for best results.
- Use Bloom in the scene for a stronger glowing look.
- Keep Emission Intensity moderate for gameplay surfaces.
- Use stronger brightness only for showcase scenes or dramatic VFX.
- Use Tiling to adjust texture scale instead of resizing the texture.
- Use Base Texture Tint for simple color variations.
- For advanced recoloring, gradient controls, alpha masking, or stronger VFX options, use the full shader packs.

Limitations

This Lite material is intentionally simplified.

It does not include:

- Custom gradient color mode
- Alpha / opacity controls
- Normal mapping
- PBR surface controls
- Advanced emission core boost
- Mask contrast controls
- Dual texture blending
- Advanced animation modules

This is a lightweight free material setup intended as an introduction to the G-Spot Lab shader workflow.

Summary

Base Color Lite provides:

- Single texture input
- Simple tint control
- Basic emission-style brightness
- Texture tiling control
- Lightweight stylized VFX surface setup

It is designed as a clean foundation for simple animated materials such as Flow Lite, Wave Lite, and Distortion Lite.
